Introduction

Blockchain technology is having an exponential growth nowadays. New projects are being launched almost every hour. Because of cryptocurrency, any ordinary person with a great idea for a project have the possibility to attract investors of gain funds to have his idea to become a reality. A small company can tokenized their product. Or a service provider can tokenized the way he transact business with their customers. A lot of project can be tokenized and I believed that now is the next generation of transacting not only online but also in the real world.

One of the great tools for this tokenization process is ethereum blockchain. Ethereum blockchain allow project developers to create a token protocol via smart contract that will communicate on the ethereum virtual machine. The token will be developed based on the project requirements and how will the developer will plan to distribute or use the token with in their project and how this token will function within the ethereum ecosystem. As of now we are using an ERC20 standard protocol for most if not all token used on ICO's within the ethereum ecosystem.

What is ERC20 Standard

The Ethereum token standard (ERC20) is used for Ethereum smart contracts. Developed in 2015, ERC20 defines a common list of rules that an Ethereum token has to implement. Giving developers the ability to program how new tokens will function within the Ethereum

ecosystem. This token protocol became popular with crowdfunding companies via Initial Coin Offering (ICO).

Why would you use the ERC20 Protocol

The tokens based on the ERC20 protocol are secure and user friendly. There is a huge support by the Ethereum community and many developers build decentralized applications around it. There is a wide availability of fully compatible wallets (i.e. Ethereum's own wallet (Mist), browser based wallets like MyEtherWallet and application based wallets like Trust mobile wallet. Also the very smart Metamask wallet is available, which is a Chrome extension. It is not hard to find ways to store your coins or send it to other people safely and conveniently.

Also trading is easy because a lot of decentralized exchanges are built inside the Ethereum Ecosystem. Exchange sites like EtherDelta, ForkDelta and Creedex, support the ERC20 standard. The token does not even have to be officially listed. You can already trade just by using your contract address.

The project

Creedexchange- Decentralized Token Market

Creedexchange is a decentralized token market that lets you buy and sell Ether and Ethereum-based tokens directly with other users. Creedexchange currently interfaces with EtherDelta's original smart contract and Forkdelta's backend upgrades which allows Creedexchange users to trade utilizing EtherDelta's volume and Forkdelta's security and api upgrades. Creedexchange is a fork of Forkdelta and currently acts as an open source, updated interface for EtherDelta's smart contract with an active and public development team and community support.

Gateway for Developers, ICO and Airdrop stage projects.

Creedexchange will serve as a front end support for project developers and crypto enthusiasts. A Creedexchange listing will allow them to test their Smart Contracts and test on how it will act on a trading platform. The platform can also be used for project promotion and/or initial exchange listing.

Integrated Community Support and Reward System.

The Integrated Community Support and Reward System will bring a new dimension to community driven front- and back end support.

Integrated ERC20 Token Exchange.

The Creedexchange exchange uses EtherDelta's original smart contract. Creedexchange users can trade all ERC20 Tokens and benefit from EtherDelta's trading volume.

Open source project.

All Smart Contracts will be made available on Github. Anyone can visit and audit and contribute to the repository.

Communitytoken

Creedextoken (CDEX)

To allow for growth of our community, we created our community/utility token, CreedexToken. CreedexToken Token will be the reward system for community members for providing valuable information, community service or any other kind of useful participation within the community. Partnership with one of the safest and fastest wallet systems will allows for easy rewards with CreedexToken own exchange token and easy transfer between community members. Community members can use the community token to tip each other, pay for services or to reward a community member or moderator. CreedexToken token will also be the official currency within the CreedexToken ecosystem, it will be used as a utility token and a currency to purchase service, digital product/assets and/or tangible item within the community.
